

Histologic Grade Paradox: NRF2-High G1 Tumours Are Immunologically Cold
Phase 1: NRF2 GSVA inversely correlated with grade (G1 median = +0.165, G3/G4 = -0.324; KW P < 0.001).
Hypothesis: G1/NRF2-High tumours are paradoxically immune-excluded despite appearing histologically indolent.
Novel: first immune-stratification of OSCC Grade Paradox linked to NRF2 redox programme.

NRF2 GSVA Score vs ImmuneScore by Histologic Grade
G1/NRF2-High: well-differentiated yet immune-excluded (the Grade Paradox)
